

Building a stronger Union – Governing the Digital Single Market

Assistant Mirela Mărcuț, PhD
Dept. of International Relations and European
Studies
University of Oradea

Contents

- Theoretical framework – discussing EU governance
- The DSM and its current governance mechanism
- Challenges of DSM governance
- How to fix/improve the mechanism?

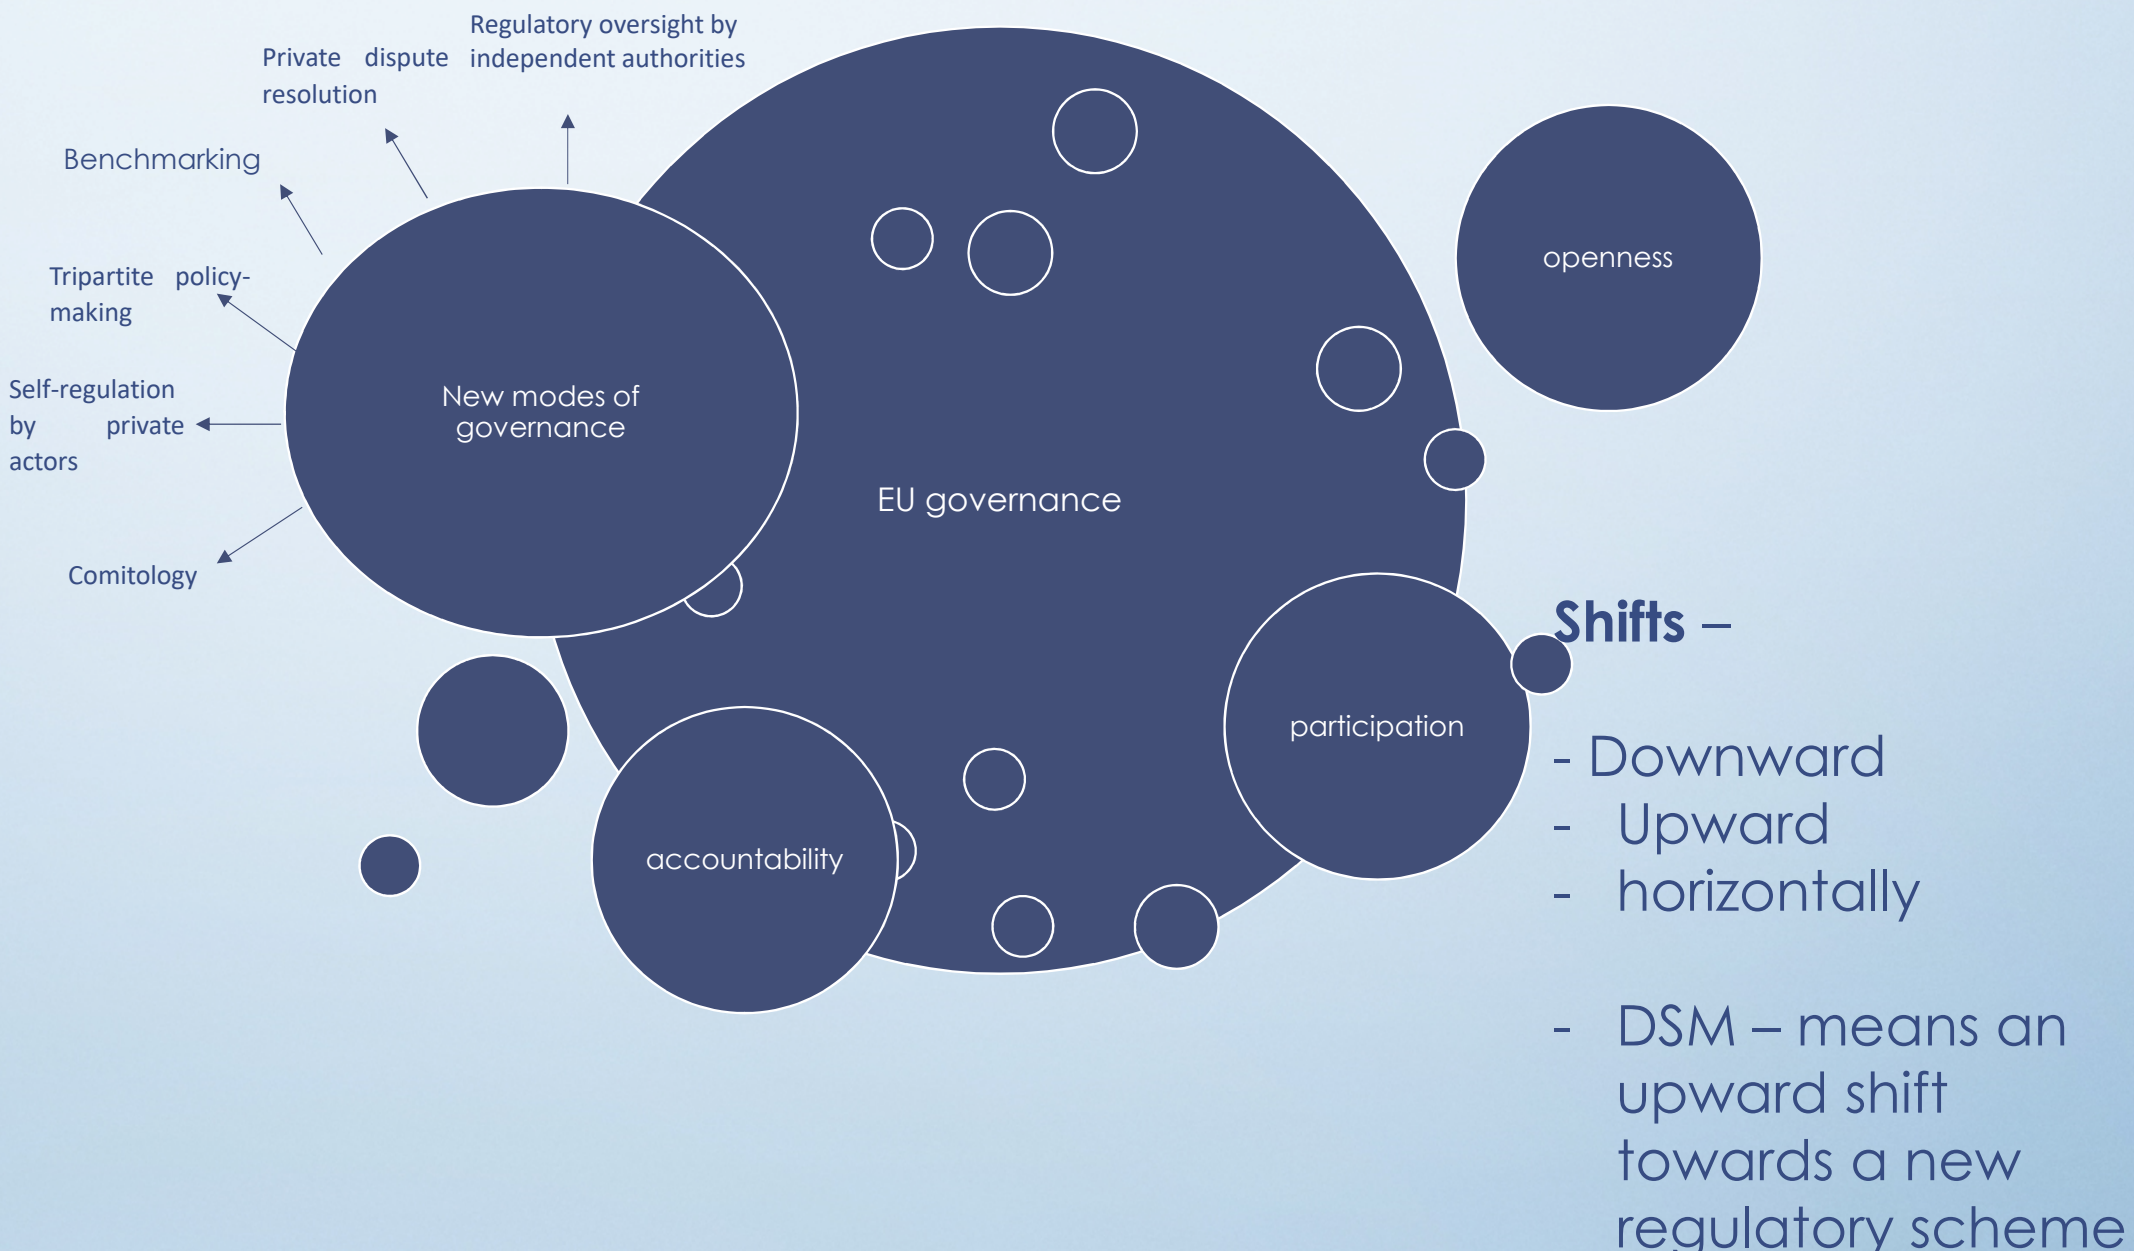

Hypothesis and major questions

- The Digital Single Market faces governance issues that should be mitigated in order to be able to create a more flexible regulatory system
- The governance mechanism of the DSM requires more flexibility because of the complicated policy targets

Theoretical framework

Discussing EU governance

New modes of governance

EU governance

openness

participation

accountability

Shifts –

- Downward
- Upward
- horizontally
- DSM – means an upward shift towards a new regulatory scheme

Benchmarking

Private dispute resolution

Regulatory oversight by independent authorities

Tripartite policy-making

Self-regulation by private actors

Comitology

Digital Single Market

Governance and functioning

DIGITAL SINGLE MARKET – political priority for the Commission

the free movement of goods, persons, services and capital is ensured and **where individuals and businesses can seamlessly access and exercise online activities under conditions of fair competition**, and a high level of consumer and personal data protection, irrespective of their nationality or place of residence

Priorities:

- ensuring access for citizens and businesses
- creating the regulatory framework necessary to its proper functioning
- focusing on the growth potential of the data economy

Focus -> digital markets (different than previous initiatives)

SOCIO-ECONOMIC IMPLICATIONS OF THE DSM

Digital technology impacts on every aspect of EU policy: **how we produce and consume energy, how we move from one place to another, how capital flows throughout Europe.**

(Mid-term review of the DSMS)

Development of the digital economy

Catching up in the competitiveness gap with the USA/China

Boosting research and innovation

Boosting research and innovation

Societal changes – labour market

Digital divide/fragmentation

Freedom of movement of data

Governance structure and mechanisms

Its **governance structure** is meant to be:

1. **Flexible** enough – so as not to exceed the limits set by the principle of subsidiarity
 2. **Strict** enough so as to ensure adoption of legislation at the EU level
- ⇒ Quite a **challenging strategy** considering that there is no official EU competence on these aspects (borrows from the internal market / R&D, industrial policy)
- ⇒ In line with Juncker's position – **act big on big, act small on small**

Its **governance mechanism**:

1. Cooperation between supranational institutions
2. The coordinating role of the Commission
3. Dialogue with stakeholders on policy advice and support for implementation
4. Technical support from advisory groups

What **new modes of governance** are used within this process?

- For regulations and frameworks in the sense of market integration – **regular policy-making + comitology** - for major legislative proposals have been heavily negotiated among the three institutions
 - o Examples of committees - Communications Committee (COCOM) / Network and Information Systems Security Committee
- Then – this legislation creates **regulatory oversight by independent authorities**
 - o **Either with a strengthened role – ENISA** (its role strengthened by NIS and other regulation) – “**has operational coordination**” powers and **cybersecurity certification**
 - o **Or with an advisory role (from the regulation ->)** – BEREC
 - o **Mixed:** European Data Protection Supervisor – has a role as a supervisor, as well as advisory
- **For re-evaluation and future issues:**
 - o **High-level expert groups** – *on fake news, on the future of labour in the digital transformation environment*
 - o *Self- regulation was the norm at the beginning of the discussions on the information society – not so much anymore*

Digital Single Market
Challenges of its
governance

STATU QUO

1. For the past 15-20 years, digital has been part of the conversation on the economic success of the EEC/EU -> especially considering the competitiveness gap of Europe in front of others
2. For the past 5 years at least – one of the VPs of the Commission has been responsible directly for the DSM (the previous commissioner as well)
3. In the near future – the draft strategic agenda of the EU (2019-2024) indicates digital transition as a key component for the development of a European economic model for the future

The signs are here -> there is gradual integration towards the digital space – as more key pieces of legislation are pursued at the EU level rather than left at the state level.

CHALLENGES TO A DSM REGULATORY FRAMEWORK – PAST AND PRESENT

1. The DSM means more regulation – to unify the 27 national regulation systems – each with their own specificity
2. The technical issues and aspects of technology in general – especially in ecommerce - that might complicate economic activity
3. National specificities
4. Preferences of consumers
5. Reluctancy to enter within a regulatory framework
6. Differences in the digital progress of countries – stemming from their socio-economic profile

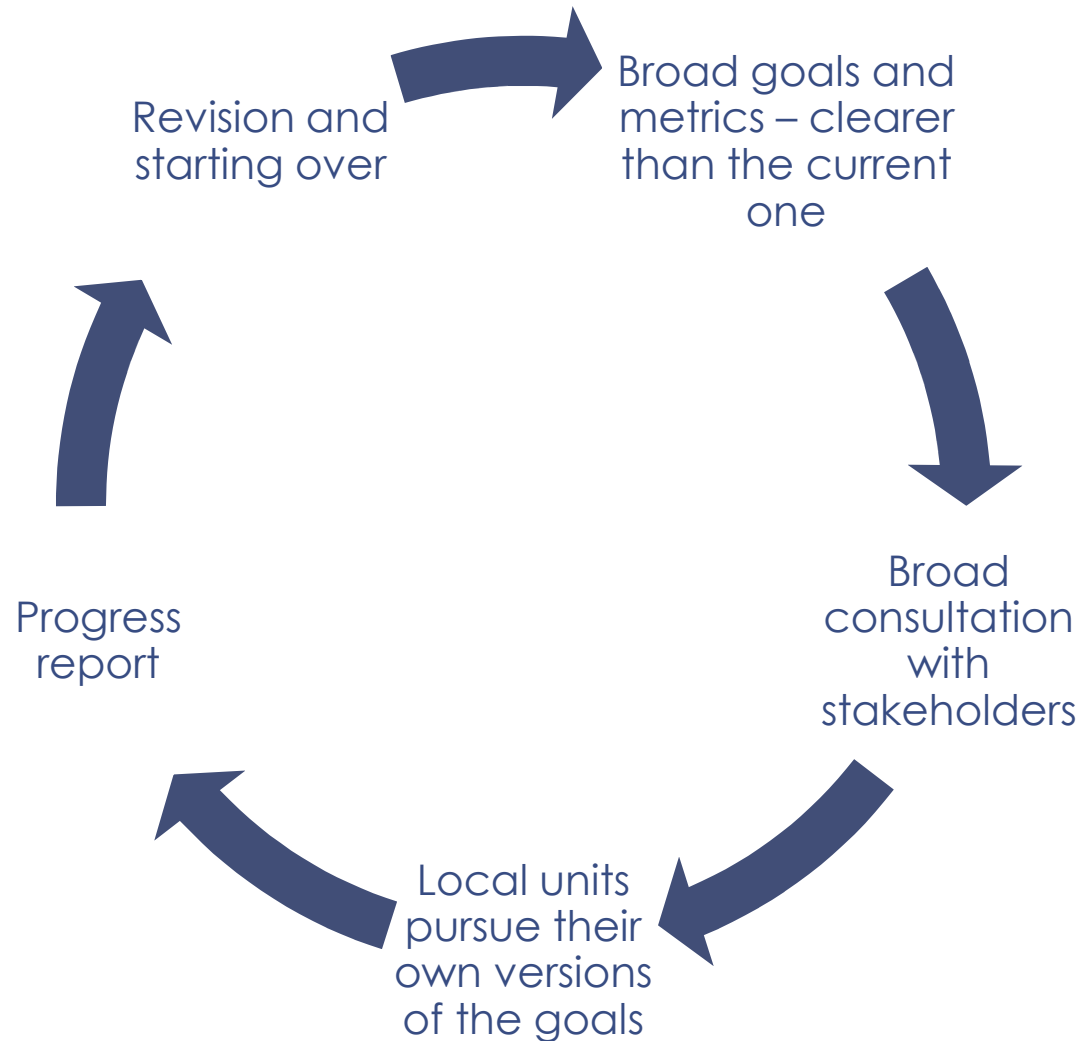

Digital Single Market

How to fix/improve
the mechanism?

Experimentalist governance – what can it fix?

- The regulating aspects of the DSM – how to transform the process and become more flexible
- Technical issues arising from these 27 different preferences
- The reluctancy of actors/the national preferences
- Differences in the digital progress

Conclusions

a. Lessons from the framework for the DSM:

- i. More benchmarking -> which is missing also from the new modes of governance mentioned by the literature – to tackle challenges at EU level
- ii. Leverage the autonomy of MS by providing new mechanisms to tackle their own challenges at home
- iii. If the MS are encouraged to tackle their own issues nationally, they may be willing to give up more on the wider EU regulation framework
- iv. Learn the lessons from local units and apply them to other ones + involve other actors
